🧩 Problem-Solution Fit Canvas: Electricity Consumption Analysis Dashboard

1. Customer Segment (CS)

The primary users include analysts, policy makers, energy researchers, and utility companies who need to understand electricity consumption patterns across regions and timeframes.

2. Jobs-to-be-Done / Problems (J&P)

These users aim to analyze electricity usage trends, compare state-wise consumption, identify anomalies, and forecast future demand. They often struggle with fragmented data sources and lack of interactive tools.

3. Triggers (TR)

Triggers include rising energy costs, new government regulations, sustainability initiatives, and public pressure for transparency. These events prompt users to seek better data tools.

4. Emotions: Before / After (EM)

Before using the dashboard, users feel overwhelmed, confused, and uncertain about data accuracy. Afterward, they feel confident, informed, and empowered to make decisions.

5. Available Solutions (AS)

Current alternatives include Excel sheets, government portals, and static PDF reports. While familiar, these tools lack interactivity, are often outdated, and require manual effort to analyze.

6. Customer Constraints (CC)

Constraints include limited technical skills, budget restrictions, poor internet connectivity in remote areas, and lack of access to advanced analytics platforms.

7. Behaviour (BE)

Users search for public datasets, manually clean and analyze data, consult experts, and use basic visualization tools. Some rely on printed reports or attend stakeholder meetings for insights.

8. Channels of Behaviour (CH)

- **Online**: Tableau dashboards, government portals, research blogs, webinars.
- **Offline**: Printed reports, workshops, stakeholder consultations.

9. Problem Root Cause (RC)

The core issue is the absence of a centralized, interactive platform that simplifies electricity consumption analysis and makes insights accessible to non-technical users.

10. Your Solution (SL)

An interactive dashboard built with Tableau that allows users to upload CSV files, apply filters, visualize trends, and export reports. It bridges the gap between raw data and actionable insights while respecting user constraints and behaviors.
